

# DVD Fab HD Decrypter Settings

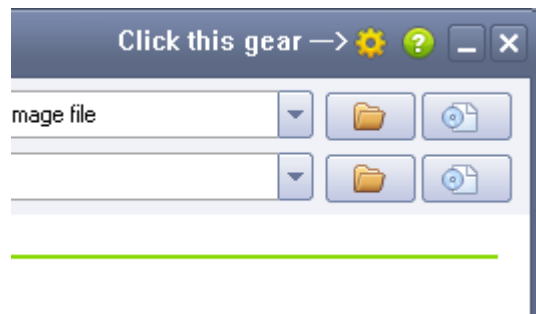

The new version of DVD Fab has a new decrypting technology named “PathPlayer”.

You will also notice that it has a new look but all of the buttons are the same and it functions the same as the “old” DVD Fab.

In order to backup and copy the latest movies you will need to enable this feature.

NOTE: If you are updating your DVD Fab please uninstall your old version and then install the new version. You will have to reset your Target folder to your \_movies folder.

1. Open DVD Fab and click the little gear button near the top right of the Fab window.

2. Now click on PathPlayer located under the DVD section (see pic).
3. Now choose “Always Enable PathPlayer” as we have done in the picture.
4. Now just click ok and put in your DVD and copy as usual.
